Challenges of knowledge translation

Jeremy Grimshaw
Clinical Epidemiology Program, Ottawa Hospital Research Institute
Department of Medicine, University of Ottawa
Cochrane Effective Practice and Organisation of Care Group
Outline

• Background
• Knowledge translation and knowledge translation science
• 3 questions
  • Can knowledge translation strategies improve clinical care?
  • How do we increase likelihood that knowledge translation strategies improve clinical care?
  • How do we embed knowledge translation into healthcare systems?
Background

- Consistent evidence of failure to translate research findings into clinical practice
- 30-40% patients do not get treatments of proven effectiveness
- 20–25% patients get care that is not needed or potentially harmful
- Suggests that implementation of research findings is fundamental challenge for healthcare systems to optimise care, outcomes and costs

Knowledge translation

CIHR definition

• Knowledge translation is a dynamic and iterative process that includes the synthesis, dissemination, exchange and ethically-sound application of knowledge to improve the health of Canadians, provide more effective health services and products and strengthen the healthcare system.

• This process takes place within a complex system of interactions between researchers and knowledge users which may vary in intensity, complexity and level of engagement depending on the nature of the research results and on the needs of the particular knowledge user.
Knowledge translation

- Knowledge translation is about ensuring that:
  - stakeholders are aware of and use research evidence to inform their decision making
  - research is informed by current available evidence and the experiences and information needs of stakeholders
Knowledge translation science

- Knowledge translation is a human enterprise that can be studied to understand and improve knowledge translation approaches.
- Knowledge translation science is the scientific study of the determinants, processes and outcomes of knowledge translation.
- Goal is to develop a generalisable empirical and theoretical basis to optimise knowledge translation activities.
Question 1

Can knowledge translation strategies improve care?
Results (research findings)

Systematic review of the effectiveness and efficiency of guideline dissemination and implementation strategies

In total, 235 studies reporting 309 comparisons met the inclusion criteria. The overall quality of the studies was poor. Seventy-three per cent of comparisons evaluated multifaceted interventions, although the maximum number of replications of a specific multifaceted intervention was 11 comparisons. Overall, the majority of comparisons reporting dichotomous process data (86.6%) observed improvements in care; however, there was considerable variation in the observed effects both within and across interventions. Commonly

Summary point 1

Do appropriately disseminated and implemented guidelines improve process (and quality) of care?

Yes!
Question 2

- Suggests the issue is not whether appropriately disseminated and implemented *valid* guidelines improve process and outcome of care.

- But....

- How do we increase likelihood that knowledge translation strategies improve clinical care?
Factors influence effectiveness of knowledge translation strategies

Ivers N et al. Audit and feedback: effects on professional practice and health care outcomes. *Cochrane Library* 2012

- Larger effects were seen if:
  - baseline compliance was low.
  - the source was a supervisor or colleague
  - it was provided more than once
  - it was delivered in both verbal and written formats
  - it included both explicit targets and an action plan

Models for optimising knowledge translation strategies

Tailored implementation for chronic diseases (TICD): A project protocol

Michel Wensing1, Andy Oxman2, Richard Baker3, Maciek Godycki-Cwirko4, Signe Flottorp5, Joachim Szecsenyi5, Jeremy Grimshaw6 and Martin Eccles7

Abstract

Background: The assumption underlying tailoring is that implementation interventions are most helpful if these effectively address the most important determinants of practice for improvement in the targeted setting. The aim of the Tailored Implementation For Chronic Diseases (TICD) project is to develop valid and efficient methods of tailoring implementation interventions to determinants of practice for knowledge implementation in chronic illness care.

Methods: The TICD project has organized the planned empirical research in three work packages that follow the three main steps of tailoring: identification of determinants of healthcare practice, matching implementation interventions to identified determinants of practice, and applying and assessing the tailored implementation interventions. These three key steps of tailored implementation will be applied to targeted chronic conditions in five different healthcare systems: cardiovascular disease in the Netherlands, obesity in England, depression in Norway, chronic obstructive pulmonary disease in Poland, and multimorbidity in Germany. The design and interpretation of empirical research will be informed by systematic reviews of previous research on tailoring implementation interventions.

Discussion: The TICD project will provide much needed evidence on the advantages and disadvantages of different methods of identifying important determinants of practice and selecting implementation strategies that take account of those. It will also provide five rigorous evaluations of tailored implementation interventions for five different chronic conditions.
Disseminating and implementing guidelines

Behavioural perspective

- Implementation depends on behaviour
  - Citizens, patients, health professionals, managers, policy makers
- To improve care, we need to change behaviour
- To change behaviour, it helps to understand determinants of current behaviour and how behaviour changes

Models for optimising knowledge translation strategies

Implementation Science

Developing theory-informed behaviour change interventions to implement evidence into practice: a systematic approach using the Theoretical Domains Framework

Summary point 2

Knowledge translation is a process that needs to be tailored to local barriers and facilitators

Emerging models of how to do this
Question 3

How do we embed knowledge translation into healthcare systems?
Embedding knowledge translation into healthcare systems

• Knowledge translation research is producing new findings that may contribute to more effective knowledge translation of research evidence

• The findings of knowledge translation research will not improve clinical care use unless knowledge translation receptors in health systems adopt them in practice
Embedding knowledge translation into healthcare systems

- Knowledge translation research is producing new findings that may contribute to more effective knowledge translation of research evidence.
- The findings of knowledge translation research will not improve clinical care use unless knowledge translation receptors in health systems adopt them in practice.
- Who are potential knowledge translation receptor sites in healthcare systems?
Embedding knowledge translation into healthcare systems

- What is the commonest knowledge translation activities that Canadian physicians engage in?

**Continuing professional education and development**

- Fellows of the RCPSC participated in at least 1.5 million hours of group learning in 2008
- Fellows of the CFPC are expected to complete 1.8 million hours of CEPD
Embedding knowledge translation into healthcare systems

• Traditional approaches to CEPD target clinical knowledge gaps using large group didactic lecture formats.
• Commonly poor use of clinical content evidence in CEPD activities
• Relatively little use of behavioural change techniques (despite evidence of effectiveness eg commitment to change)
• Suggests that CEPD providers are potential audience for knowledge translation research
Embedding knowledge translation research into healthcare systems

Research projects

- Majority of current KT research involve one off projects requiring convening *de novo* research teams, seeking project by project funding, negotiating access with healthcare systems, conducting study, writing up (usually out of funding period)

- Creates problems with:
  - Efficiency (for research team, healthcare system)
  - Failure to maximise learning from individual projects
  - Failure to communicate learning from individual projects
  - Intellectual continuity (fails to develop cumulative knowledge)
  - Promoting interdisciplinarity
Embedding knowledge translation research into healthcare systems

Research laboratories

- Research teams integrated into healthcare systems undertaking program(s) of research directly relevant to healthcare systems’ priorities
- Reduces problems relating to convening *de novo* research teams, seeking project by project funding, negotiating access with healthcare systems, conducting study, writing up (usually out of funding period)
- Opportunities for formal and informal linkages of mutual advantage to research team and healthcare system
- More explicitly recognise relatives roles and responsibilities of research team and healthcare system
Embedding knowledge translation research into healthcare systems

TRiADS
Translation Research in a Dental Setting
Embedding knowledge translation research into healthcare systems

- TRIADS is an example of a knowledge translation research program embedded into a healthcare system guidance development program
- Maximises opportunities for embedded knowledge translation in real world settings that directly translates into Scottish health system
- Shared generation of knowledge between guidance development team, educational delivery teams and interdisciplinary knowledge translation research team
Embedding knowledge translation research into healthcare systems

STUDY PROTOCOL

The translation research in a dental setting (TRiaDS) programme protocol

Jan E Clarkson1*, Craig R Ramsay2, Martin P Eccles3, Sandra Eldridge4, Jeremy M Grimshaw5, Marie Johnston6, Susan Michie7, Shaun Treweek8, Alan Walker9, Linda Young10, Irene Black9, Debbie Bonetti7, Heather Cassie1, Jill Francis2, Gillian MacKenzie10, Lorna MacPherson11, Lorna McKee7, Nigel Pitts1, Jim Rennie12, Doug Stirling10, Colin Tilley13, Carole Torgerson14, Luke Vale2

Abstract

Background: It is well documented that the translation of knowledge into clinical practice is a slow and haphazard process. This is no less true for dental healthcare than other types of healthcare. One common policy strategy to help promote knowledge translation is the production of clinical guidance, but it has been demonstrated that the simple publication of guidance is unlikely to optimise practice. Additional knowledge translation interventions have been shown to be effective, but effectiveness varies and much of this variation is unexplained. The need for researchers to move beyond single studies to develop a generalisable, theory-based, knowledge translation framework has been identified.
Embedding knowledge translation research into healthcare systems

**Implementing Change to Transform Healthcare Systems**

Open Access

**Setting**

Jeanmshaw, Marie Johnston, Bonetti, Heather Cassie, Kim Rennie, Doug Stirling.

Practice is a slow and complex process. One common policy solution is to introduce change, but it has been challenging to translate knowledge into practice. Additional knowledge is needed, and much of this variation is due to generalisability, theory based, and evidence-based approaches.
Summary 3

• Maximising benefits from knowledge translation research requires engagement with knowledge translation receptors in healthcare systems
• Emerging models of how to do this
• TRIADS is an unique example of a knowledge translation research laboratory that embeds a knowledge translation research program within a healthcare system
